I "A myb-related gene of the Kyoho grape (Vitis labruscana) reg

I anthocyanin biosynthesis in grapes.;

L Submitted (OCT-2001) to the EMBL/GenBank/DDBJ databases.

-!- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

-!- SIMILARITY: CONTAINS 2 MYB-LIKE DOMAINS.

```
The present sequence represents tomato anthocyanin 1 (ANT1). The ANT1 polynucleotide can be used for modifying the expression of a native plant gene, particularly for producing an anthocyanin 1 phenotype in plants, which is responsible for many red and blue colours in plants. The polynucleotide is useful for modifying e.g. leaf colour, flower colour or fruit colour in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide derived from tomato, useful for producing an Anthocyanin 1 phenotype in plants, particularly for modifying e.g. leaf color, flower color or fruit color in plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify the plants or seeds, to modify the insoluble sugar content of seeds, to modify plants and modify wax content. They may also be used to alter seed characteristics such as shelf-life, size, stress colerance, seedling vigour, pest and pathogen resistance and germination rate. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Reuber L,

                                                                                                                                                                                                         The present sequence is homologue G2422 of Arabidopsis thaliana transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify the insoluble sugar content of seeds, to modify the oil content. They may also be used to alter seed characteristics such as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germinatio rate. They may also be used in gene therapy. Therefore manipulating agricultural highestance in plants offers great potential in

Claim 40; Page 880-881; 941pp; English

CC encoding an Arabidopsis thaliana transcription factor, their variants, CC encoding an Arabidopsis thaliana transcription factor, their variants, CC complements, fragments, or related polynucleotide with 31% to 95% CC sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered CC phenotype as compared to a wild-type or reference plant, or the plant of one or more genes CC associated with a plant trait as compared to a wild plant. Also included CC are a transgenic plant comprising the polynucleotides, a computer CC readable medium having stored sequence information, and identifying a CC homologue sequence from a database comprising a plurality of known plant CC sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or CC recombinant polynucleotide is used for producing a plant having a CC modified trait, the method comprising selecting a polynucleotide that CC encodes a polypeptide or an antisense nucleic acid, inserting the polynucleotide to a plant to a cell of a plant to overexpress CC the polypeptide or antisense nucleic acid, thereby producing a modified C production of agriculturally useful proteins or metabolic chemicals, gest tolerance, herbicide resistance, seed and fruit yield, growth contact of the co The invention relates to 1 of 232 isolated or recombinant polynucleotides

                                                                                The present sequence represents a plant stress tolerance-related myloblastosis (MYB) transcription factor. The specification describes AtMYB60, AtMYB764, AtMYB75 and AtMYB90. MYB polypeptides are useful fo enhancing a plant's tolerance or sensitivity to stress e.g. salt, drought, cold and heat tolerance. It is also useful for producing a transgenic plant with enhanced stress tolerance or stress sensitivity. MYB polypeptides are also useful for increasing the production of products of the phenylpropanoid biosynthesis pathway, e.g. stilbenes, flignins, salicylic acid, anthocyanins, and phenolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecules encoding plant stress tolerance-related myloblastosis transcription factors for increasing stress resia crop in a field -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination ratio. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stress tolerance; myloblastosis transcription factor; heat tolerance; MYB transcription factor; AtMYB60; AtMYB764; AtMYB75; transgenic plant; phenylpropanoid biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAB68356;

The invention relates to 1 of 232 isolated or recombinant polynucleotides CC encoding an Arabidopsis thaliana transcription factor, their variants, CC complements, fragments, or related polynucleotide with 31% to 95% CC sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered CC phenotype as compared to a wild-type or reference plant, or the plant c or more genes CC associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer CC readable medium having stored sequence information, and identifying a CC homologue sequence from a database comprising a plurality of known plant CC sequences comprising inputting sequence information, and identifying a CC sequences comprising inputting sequence information. The isolated or recombinant polynucleotide is used for producing a plant having a CC modified trait, the method comprising selecting a polynucleotide that

The present sequence is one of the 232 proteins which an A. thaliana transcription factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PAP2; production of anthocyanin pigment; MYB-like transcription factor; transgenic; plant; phenylpropanoid; stress; light stress; water stress; phenylpropanoid; stress; pathogen attack; phenylprotuce stress; heavy metal stress; pathogen attack; infection; wounding; nutrient deficiency; herbivory; plant colouration;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC 1. PAP1 and PĀP2 are MYB-like transcription factors that regulate the CC production of anthocyanin pigment. The nucleotide sequence of the CC invention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The nucleotide sequence is also useful for screening for plant cell. The CA. thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour expression. The nucleotide sequence is also useful for enhancing CC expression. The nucleotide sequence is also useful for enhancing CC commulation of phenylpropanoid product in a plant. A transgenic CC plant is useful for detecting a stress condition such as light CC stress, water stress, pH stress, temperature stress, heavy metal CC stress, pathogen attack or infection, wounding, nutrient deficiency, CC herbivory, or abnormal hormone levels in a plant. PAP1 or PAP2 colouration in ornamental plants for commercial sales, and for colouration plants to stress. Introduction of PAP1 or PAP2 sensitises or lants to respond more contaction of PAP1 or PAP2 sensitises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC polynucleotides encodes a biosynthetic pathway transcription factor or cc a primary metabolite pathway gene or a secondary metabolite pathway gene condary metabolite pathway gene such as a terpenoid or alkaloid pathway gene transcription factor. It is also useful for identifying one or more where the terpenoid conditions activate one or more genes of a biological pathway of a plant, fungi or animal cell, where the biological pathway can be a biochemical pathway condition as the condition of a response pathway to abiotic stress such as cold, condition are such as fungal, viral or bacterial infection, developmental pathway such as cold, condition intensity and light quality, circadian rhythm. Sequences condition is such as light intensity and light quality, circadian rhythm. Sequences condition is arbitable can broshem are used to generate transgenic plants. The present of the invention are used to generate transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a plant stress tolerance-related myloblastosis (MYB) transcription factor. The specification describes AtMYB60, AtMYB64, AtMYB75 and AtMYB90. MYB polypeptides are useful f enhancing a plant's tolerance or sensitivity to stress e.g. salt, drought, cold and heat tolerance. It is also useful for producing a transgenic plant with enhanced stress tolerance or stress sensitivity MYB polypeptides are also useful for increasing the production of products of the phenylpropanoid biosynthesis pathway, e.g. stilbenes, divinctional lignins, salicylic acid, anthocyanins, and phenolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 200

controlled sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense nucleic acid, inserting the polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 proteins which are
                                                                                                                                                                                                                                                                                                                                                                         encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to 1 of 232 isolated or recombinant polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 40;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An isolated or recombinant polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                        ঠ
                                                                                                                                                                                                                                                                                                                                             RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to the nucleotide and protein sequences of novel CC Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 CC or PAP2. The genes for both PAP1 and PAP2 have been mapped to chromosome CC 1. PAP1 and PAP2 are MYB-like transcription factors that regulate the production of anthocyanin pigment. The nucleotide sequence of the crimvention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The nucleotide sequence is also useful for screening for plant cell (e.g., A. thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour expression. The nucleotide sequence is also useful for enhancing cacumulation of phenylpropanoid product in a plant. A transgenic colour tis useful for detecting a stress condition such as light colour stress, water stress, pH stress, temperature stress, heavy metal stress, pathogen attack or infection, wounding, nutrient deficiency, charters, pathogen attack or infection, wounding, nutrient deficiency, colouration in ornamental plants for commercial sales, and for colouration in ornamental plants for commercial sales, and for colouration plants to stress. Introduction of PAP1 or PAP2 sensitises colouration in a part of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Loc

The plant is especially a cotton plant, and the promoter directs expression of the polynucleotide in cotton fibres or roots. Valuable phenotypes can be conferred on the plant by this method, e.g. increased fibre quality, yield, length, strength or fineness, alteration of root
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modulating transcription in plants for improving cotton fiber quality, comprises introducing a recombinant expression cassette comprising a promoter operably linked to a sequence encoding a MYB polypeptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: ball, b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide

                           Sequence 6229, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 6229
LENGTH: 289
TYPE: PRT
                                                                                                                                                                                                                                                                                                                                                                                                   Matches
